Registration Number : 25BCE11104

Branch : CSE(Core)

Year : 1st Year

Course Code : CSE0001

Role : Student Digital Ambassador

Date : 30/03/2026

Introduction

Digital literacy has become a necessary skill for living in this technologically advanced world we're currently living in. In addition to learning how to use various online tools, students have to learn how to stay safe when communicating via the internet, how to communicate properly via the internet, and about responsible online behaviour. This project is designed for individuals who want to learn about the different types of digital platforms available, how to behave respectfully when communicating via the internet, and how to protect themselves from being cyber-crime victims.

The project consists of many tasks that teach individuals how to create videos/images for use on the Internet; develop a digital portfolio to showcase their work; sample coding; explore other digital tools that allow teams to collaborate; and how to reduce the number of cyber-crimes. Each task provides individuals with an opportunity to try tools commonly used in educational and corporate settings.

This project is beneficial because it provides individuals with the confidence to effectively use technology and educates them on using technology in a responsible manner. Digital literacy is very important for success in school now and for obtaining future employment. The project focuses on developing digital literacy, which will allow individuals to use digital technology efficiently.

Task 1: Digital Literacy Awareness Infographic

For task 1, I created an infographic for digital literacy awareness. I chose Canva for the creation of the infographic. I like Canva because it is simple and provides a wide variety of templates and icons that make my work look good.

The infographic is about what is meant by digital literacy and why it is important for students. The infographic is divided into different sections that explain what digital literacy is and also informs students about different tools such as Google Docs and Canva. The infographic also provides information on how to be safe online by using passwords and not clicking on bad links. The infographic provides information on how to look professional online.

The infographic provides some tips on how to write emails too.

The infographic is simple and easy to read. The difficult part for me was to make it look good and fun. Keeping it simple and easy to read is not difficult. The difficult part is selecting the right pictures and words and ensuring that they go well together. Digital literacy is important. I tried to ensure that the infographic showed this.

Task 2: Student Digital Portfolio

For task 2, I have developed my digital portfolio on three different platforms: GitHub, LinkedIn, and Kaggle. All these platforms are very popular among students and professionals for establishing a strong digital presence.

GitHub is a site for developers to share their programming work. I have made a profile README file where I have introduced myself and mentioned my learning objectives. LinkedIn is a professional network site. I have added my educational information on LinkedIn, which will help me connect with potential employers for internship opportunities. Kaggle is a data science and machine learning site. I will use this site to learn from different data sets and improve my skills in data analysis.

Over the next four years, I will continue to update my GitHub profile by adding more programming work, update my LinkedIn profile by adding skills and accomplishments, and utilize Kaggle for improving my skills in data analysis. I believe that by developing this digital portfolio, I can enhance my career prospects.

Task 3: Coding & Collaboration Platforms

In Task 3, I was able to explore a coding practice platform and a cloud collaboration tool. I was able to practice my coding skills using a platform called HackerRank, where I was able to solve a beginner-level problem known as "Solve Me First." This allowed me to gain knowledge on basic programming logic.

Regarding collaboration, I was able to create a "Digital Literacy Awareness Quiz" using a tool called Google Forms, targeting my batchmates. I was able to create a form with five different questions, such as multiple choice and short answer, to assess basic knowledge on digital literacy. I was also able to view responses to the form using a tool called Google Sheets, allowing me to gain knowledge on how to easily collect and analyze data.

These tools will be very helpful to me in my academic journey, as I will be able to enhance my coding skills using a tool such as HackerRank, and I will be able to conduct surveys, quizzes, and collect feedback using a tool such as Google Forms.

Task 4: Email Etiquette & Communication

Poor digital communication may result in serious misunderstandings. For instance, a student once sent an email to a professor with a casual tone and no subject line in the email header. The message was not clear, and the professor thought it was unprofessional, which led to a situation where the professor ignored the message.

This situation would have been handled in a better manner by using proper email etiquette. The student would have used a proper subject line, a greeting, and a proper message with a clear explanation of the problem. Keeping a professional tone and checking the message before sending would have helped in getting a prompt reply.

This is a clear example of why digital communication is so vital in a professional setup.

Task 5: Cybercrime Awareness Case Study

During my research on UPI scams, the most surprising factor is how people can be easily duped into making transactions by simply scanning a QR code or sharing some basic information like OTPs. People are unaware of the fact that there is no need to enter a PIN code or scan a QR code when they are being sent money.

This research has taught me a lot about how important it is to be cautious when using digital payment systems. The one thing I am going to inculcate in my own self is being more careful before clicking on any link or before attending any unknown call or message. It is not just going to benefit me in my own way; it is also going to help me guide others in a better way regarding how they can avoid these cybercrimes.

Conclusion

This project has given us important insights about digital literacy, online safety, and professional communication. This project has helped us to develop skills in creating infographics, creating a digital portfolio, and learning to code, among other things.

From this project, we have learned important lessons about online safety and communication. The knowledge gained from this project will be important in the future, whether in school or in the workplace. This project has helped us build confidence in using technology and has prepared us for the challenges ahead in a technology-driven world.
